

cp_1d

1.

Sum of two numbers | 🏆 10/10

Write a program to print the sum of two integer inputs A and B.

Input

The first line contains the integer A

The second line contains the integer B

Sample Input 1

```
2
3
```

Sample Output 1

```
5
```

Sample Input 2

```
20
1
```

Sample Output 2

```
21
```

code:

```
n1=int(input())
n2=int(input())
n=n1+n2
print(n)
```

2.

Division of two numbers | 🟡 10/10

Easy

Write a program that reads two numbers A and B and prints the division of two numbers (A / B).

Input

The first line of input contains an integer.
The second line of input contains an integer.

Output

The output should be a single line containing a float obtained by the division of two numbers.

Explanation

For example, if the given numbers are **15** and **3**, the output should be **5.0** as the division of 15 and 3 (`15 / 3`) is **5.0**.

Sample Input 1

```
15
3
```

Sample Output 1

```
5.0
```

Sample Input 2

```
5
2
```

Sample Output 2

```
2.5
```

code:

```
n1=int(input())
n2=int(input())
n=n1/n2
print(n)
```

3.

Area of a Rectangle | 🟡 15/15

Write a program to calculate the area of the Rectangle.

Note: Area of Rectangle = Length of Rectangle x Breadth of Rectangle

Input

The first line of input contains the length of the rectangle, which is an integer.

The second line of input contains the breadth of the rectangle, which is an integer.

Output

Print the Area of Rectangle

Explanation

For example, when the length is 4 and breadth is 3, then $A = 3 \times 4$, therefore $A = 12$

Sample Input 1

```
3
4
```

Sample Output 1

```
12
```

Sample Input 2

```
5
3
```

Sample Output 2

```
15
```

code:

```
n1=int(input())
n2=int(input())
n=n1*n2
print(n)
```

4.

Perimeter of Rectangle | 🟡 15/15

Write a program to calculate the perimeter of a rectangle.

Note: Perimeter of Rectangle = $2(\text{Length of Rectangle} + \text{Breadth of Rectangle})$

Input

The first line of input contains the length of the rectangle, which is an integer.

The second line of input contains the breadth of the rectangle, which is an integer.

Output

Print the Perimeter of the Rectangle

Explanation

For example, when the length of the rectangle is 3 and breadth is 4, then

Perimeter = $2 \times (3 + 4) = 2 \times 7 = 14$

Sample Input 1

```
3
4
```

Sample Output 1

```
14
```

Sample Input 2

```
5
3
```

Sample Output 2

```
16
```

code:

```
n1=int(input())
n2=int(input())
n=2*(n1+n2)
print(n)
```

5.

Division of two numbers - 2 | 🟡 15/15

Easy

Write a program that reads two numbers A and B and prints the division of two numbers (A / B) as an integer.

Input

The first line of input contains an integer.
The second line of input contains an integer.

Output

The output should be a single line containing an integer that is the integer value of the result obtained from the division of two numbers.

Explanation

For example, if the given numbers are **21** and **4**,

- The division of 21 and 4 ($21 / 4$) is **5.25**
- The integer of **5.25** is **5**

The output should be **5**.

Sample Input 1

```
21
4
```

Sample Output 1

```
5
```

Sample Input 2

```
8
4
```

Sample Output 2

```
2
```

code:

```
n1=int(input())
n2=int(input())
n=n1/n2
print(int(n))
```

6.

Subtraction of two numbers | 🟡 15/15

Easy

Write a program that reads two numbers A and B and prints the subtraction of two numbers (A - B).

Input

The first line of input contains a float.
The second line of input contains a float.

Output

The output should be a single line containing a float obtained by the subtraction of two numbers.

Explanation

For example, if the given numbers are **15.55** and **6.23**, the output should be **9.32** as the subtraction `15.55 - 6.23` is **9.32**.

Sample Input 1

```
15.55
6.23
```

Sample Output 1

```
9.32
```

Sample Input 2

```
1.4
2.5
```

Sample Output 2

```
-1.1
```

code:

```
n1=float(input())
n2=float(input())
n=n1-n2
print(float(n))
```

7.

Percentage of Boys | 🟡 15/15

Easy

Write a program that reads the percentage of girls in a class and prints the percentage of boys in the class.

Note

Total Percentage of Boys and Girls in a class is 100.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing an integer that is the percentage of boys in the class.

Explanation

For example, if the given percentage of girls in the class is **30**,

- The total percentage is **100**.
- The percentage of girls **30** should be removed from the total percentage **100** to get the percentage of boys in the class.

The output should be **70**.

Sample Input 1

30

Sample Output 1

70

Sample Input 2

80

Sample Output 2

20

code:

```
n=100-int(input())
print(n)
```

8.

Sum of two numbers - 2 | 🟡 20/20

Easy

Write a program that reads two numbers and prints the sum of two numbers in the given format.

Input

The first line of input contains a float.
The second line of input contains a float.

Output

The output should be a single line containing a string in the format shown in the sample output.

Explanation

For example, if the given numbers are **3.0** and **4.0**,

- The sum of **3.0** and **4.0** (`3.0 + 4.0`) is **7.0**.
- Add the string "**Sum:** " before **7.0** (sum of two numbers).

The output should be **Sum: 7.0**

Sample Input 1

```
3.0
4.0
```

Sample Output 1

```
Sum: 7.0
```

Sample Input 2

```
2.1
10.5
```

Sample Output 2

```
Sum: 12.6
```

code:

```
n=float(input())
m=float(input())
o=n+m
print("Sum: "+str(o))
```

9.

Kilometers to Meters | 🟡 15/15

Write a program to take the number of kilometers as input and convert into meters and print the number of meters.
Note: 1 Kilometer = 1000 Meters

Input

The first line of input contains the number of kilometers.
The input will have a decimal part.

Output

The first line of output contains the number of meters.
The output should be an integer.

Explanation

For example, 1.2 kilometers is equals to 1200 meters

Sample Input 1

```
1.2
```

Sample Output 1

```
1200
```

Sample Input 2

```
3.5
```

Sample Output 2

```
3500
```

code:

```
kilometer=float(input())  
meter=kilometer*1000  
print(int(meter))
```

10.

Percentage 20/20

Solved

Easy

Write a program that reads a percentage `P` and prints the percentage `P` of the number `200`.

Note

The Percentage (`P`) of Number (`N`) can be calculated as:

`value = (percentage / 100) * number`

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a float that is the `P` percentage of `200`.

Explanation

For example, if the given percentage is `P = 50`, the `50` percent of number `200` is,

```
value = (percentage / 100) * number
value = (50 / 100) * 200
value = 0.5 * 200
value = 100.0
```

The output should be `100.0`.

Sample Input 1

50

Sample Output 1

100.0

Sample Input 2

30

Sample Output 2

60.0

code:

```
P=int(input())
n=200
value=(P/100)*n
print(float(value))
```

11.

Easy

Write a program that reads a dividend and a divisor and prints the remainder.

Note

For Example, if 7 is divided by 2 (7/2),

Dividend: 7

Divisor $\leftarrow$ 2) 7 (3 $\rightarrow$ Quotient

6

1 $\rightarrow$ Remainder

Formula to Calculate Remainder:

Quotient should be an integer to calculate the remainder.

remainder = dividend - (divisor * quotient)

Input

The first line of input contains an integer.

The second line of input contains an integer.

Output

The output should be a single line containing an integer that is the remainder.

Explanation

For example, if the given dividend is 7 and the divisor is 2,

- The quotient is 3.5 ($7/2$).
- The integer of 3.5 is 3.
- The remainder is 1 as shown below.

```
remainder = dividend - (divisor * quotient)
```

```
remainder = 7 - (2 * 3)
```

```
remainder = 7 - 6
```

```
remainder = 1
```

The output should be 1.

Sample Input 1

```
7
2
```

Sample Output 1

code:

```
dividend=int(input())
divisor=int(input())
remainder=dividend%divisor
print(remainder)
```
