

cp_2a

1

Greater than 70 | 🟡 15/15

Easy

Write a program that reads a number and checks if the given number is greater than 70.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a boolean. **True** should be printed if the given number is greater than 70, otherwise **False** should be printed.

Explanation

For example, if the given number is 86, the output should be **True** as 86 is greater than 70.

Sample Input 1

86

Sample Output 1

True

Sample Input 2

45

Sample Output 2

False

code:

```
num=int(input())  
print(num>70)
```

2.

Greatest among two numbers | 🟡 10/10

● Solved

Easy

Write a program that reads two numbers and checks if the first number is greater than the second number.

Input

The first line of input contains an integer.
The second line of input contains an integer.

Output

The output should be a single line containing a boolean. **True** should be printed if the first number is greater than the second number, otherwise **False** should be printed.

Explanation

For example, if the given numbers are **6** and **4**, the output should be **True** as **6** is greater than **4**.

Sample Input 1

```
6
4
```

Sample Output 1

```
True
```

Sample Input 2

```
13
17
```

Sample Output 2

```
False
```

code:

```
n1=int(input())
n2=int(input())
print(n1>n2)
```

3.

Negative Number | 🟡 15/15

Easy

Write a program that reads a number and checks if the given number is a negative number.

Note

Negative numbers are numbers that are less than zero.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a boolean. **True** should be printed if the given number is a negative number, otherwise **False** should be printed.

Explanation

For example, if the given number is **-25**, the output should be **True** as **-25** is less than zero.

Sample Input 1

-25

Sample Output 1

True

Sample Input 2

3

Sample Output 2

False

code:

```
num=int(input())  
print(num<0)
```

4.

Equal to | 🟡 10/10

Easy

Write a program that reads two words and checks if the given two words are the same.

Input

The first line of input contains a string.
The second line of input contains a string.

Output

The output should be a single line containing a boolean. **True** should be printed if the given two words are the same, otherwise **False** should be printed.

Explanation

For example, if the given words are **Jam** and **Jam**,

The output should be **True** as both the words **Jam** and **Jam** are the same.

Sample Input 1

```
Jam
Jam
```

Sample Output 1

```
True
```

Sample Input 2

```
Dog
Cow
```

Sample Output 2

```
False
```

code:

```
w1=input()
w2=input()
print(w1==w2)
```

5.

code:

Sunday | 15/15

Easy

Write a program that reads a day number and checks if the given day is a Sunday.

Day	Day Number
Monday	1
Tuesday	2
Wednesday	3
Thursday	4
Friday	5
Saturday	6
Sunday	7

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a boolean. **True** should be printed if the given day is Sunday, otherwise **False** should be printed.

Explanation

For example,

- if the given day number is **7**, the output should be **True** as **7** is equal to the day number of Sunday which is **7**.
- if the given day number is **4**, the output should be **False** as **4** is not equal to the day number of Sunday which is **7**.

Sample Input 1

7

Sample Output 1

True

Sample Input 2

1

Sample Output 2

False

```
n1=int(input())
print(n1==7)
```

6.

Not Equal to | 🟡 15/15

● Sol

Easy

Write a program that reads two numbers and checks if the given two numbers are not the same.

Input

The first line of input contains an integer.
The second line of input contains an integer.

Output

The output should be a single line containing a boolean. **True** should be printed if the given two numbers are not the same, otherwise **False** should be printed.

Explanation

For example, if the given numbers are **2** and **3**, the output should be **True** as **2** is not equal to **3**.

Sample Input 1

```
2
3
```

Sample Output 1

```
True
```

Sample Input 2

```
10
10
```

Sample Output 2

```
False
```

code:

```
n1=int(input())
n2=int(input())
print(n1!=n2)
```

7.

Greater than or Equal to 🟡 10/10

Easy

Write a program that reads two numbers `A` and `B` and checks if `A` is greater than or equal to `B`. Print the result as shown in the sample output.

Input

The first line of input contains a float.
The second line of input contains a float.

Output

The output should be a single line containing a string as shown in the sample output.

Explanation

For example, if the given numbers are `A = 4.3` and `B = 3.2`,

- `A` is greater than or equal to `B` : **True**, (4.3 is greater than or equal to 3.2)
- Add the string "`A >= B is` " before **True**.

The output should be `A >= B is True`.

Sample Input 1

```
4.3
3.2
```

Sample Output 1

```
A >= B is True
```

Sample Input 2

```
9.9
10.0
```

Sample Output 2

```
A >= B is False
```

code:

```
n1=float(input())
n2=float(input())
n=(n1>=n2)
print("A >= B is "+str(n))
```

8.

Less than or Equal to | 10/10

Solved

Easy

Write a program that reads two numbers and checks if the first number is less than or equal to the second number.

Input

The first line of input contains an integer.
The second line of input contains a float.

Output

The output should be a single line containing a boolean. **True** should be printed if the first number is less than or equal to the second number, otherwise **False** should be printed.

Explanation

For example, if the given numbers are **2** and **5.3**, the output should be **True** as **2** is less than **5.3**.

Sample Input 1

```
2
5.3
```

Sample Output 1

```
True
```

Sample Input 2

```
13
10.3
```

Sample Output 2

```
False
```

code:

```
n1=int(input())
n2=float(input())
print(n1<=n2)
```
