1.

Greater than Nine | 🏆 15/15

Easy

Write a program that reads two numbers `A` and `B` , and checks if both the given numbers are greater than `9`.

Input

The first line of input contains an integer representing `A` .
The second line of input contains an integer representing `B` .

Output

The output should be a single line containing a boolean. **True** should be printed if both the given numbers are greater than `9`, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = 11` and `B = 20` ,

✓ `A` is greater than `9`. (`11` is greater than `9`)

✓ `B` is greater than `9`. (`20` is greater than `9`)

The output should be **True** as both the given numbers are greater than `9`.

Sample Input 1

```
11
20
```

Sample Output 1

```
True
```

Sample Input 2

```
9
43
```

Sample Output 2

```
False
```

code:

```
A=int(input())
B=int(input())
print(A>9 and B>9)
```

2.

Negative Numbers | 🟡 15/15

Easy

Write a program that reads two numbers `A` and `B`, and checks if both the given numbers are negative numbers.

Note

Negative numbers are numbers that are less than zero.

Input

The first line of input contains an integer representing `A`.

The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a boolean. **True** should be printed if both the given numbers are negative, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = -1` and `B = -2`,

✓ `A` is a negative number. (`-1` is less than `0`)

✓ `B` is a negative number. (`-2` is less than `0`)

The output should be **True** as both the given numbers are negative.

Sample Input 1

```
-1
-2
```

Sample Output 1

```
True
```

Sample Input 2

```
3
-1
```

Sample Output 2

```
False
```

code:

```
A=int(input())
B=int(input())
print(A<0 and B<0)
```

3.

Positive Number | 🟡 15/15

Easy

Write a program that reads two numbers `A` and `B`, and checks if one of the given numbers is a positive number.

Note

Positive numbers are numbers that are greater than zero.

Input

The first line of input contains an integer representing `A`.
The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a boolean. **True** should be printed if one of the given numbers is a positive number, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = 4` and `B = -6`,

✓ `A` is a positive number. (4 is greater than 0)

✗ `B` is a positive number. (-6 is greater than 0)

The output should be **True** as one of the given numbers is a positive number.

Sample Input 1

```
4
-6
```

Sample Output 1

```
True
```

Sample Input 2

```
-12
-22
```

Sample Output 2

```
False
```

code:

```
A=int(input())
B=int(input())
print(A>0 or B>0)
```

4.

Not Greater than 100 | 🟡 15/15

● Sc

Easy

Write a program that reads two numbers `A` and `B`, and checks if the sum of `A` and `B` is **not greater than 100**.

Input

The first line of input contains an integer representing `A`.

The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a boolean. **True** should be printed if the sum of `A` and `B` is not greater than **100**, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = 30` and `B = 20`,

- The sum of `A` and `B` is **50** (`30 + 20 = 50`).

The output should be **True** as the sum of `A` and `B` is **not greater than 100**.

Sample Input 1

```
30
20
```

Sample Output 1

```
True
```

Sample Input 2

```
60
70
```

Sample Output 2

code:

```
A=int(input())
B=int(input())
c=A+B
print(c<=100)
```

5.

Compare Numbers | 🟡 20/20

● Solved

Easy

Write a program that reads two numbers `A` and `B`, and checks if both `A` and `B` are greater than `35` or `A` is greater than `B`.

Input

The first line of input contains an integer representing `A`.
The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a boolean. **True** should be printed if both `A` and `B` are greater than `35` or `A` is greater than `B`, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = 45` and `B = 25`,

✗ `A` and `B` are greater than `35`. (`45` is greater than `35` but `25` is less than `35`)

✓ `A` is greater than `B`. (`45` is greater than `25`)

The output should be **True** as `A` is greater than `B`.

Sample Input 1

```
45
25
```

Sample Output 1

```
True
```

Sample Input 2

```
35
90
```

Sample Output 2

```
False
```

code:

```
A=int(input())
B=int(input())
print(( (A>35) and (B>35) ) or A>B)
```

6.

Compare Numbers - 2 | 🟡 20/20

● Solve

Easy

Write a program that reads two numbers `A` and `B`, and checks if one of the given numbers is a negative number and the sum of the given numbers is greater than `7`.

Input

The first line of input contains an integer representing `A`.

The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a boolean. **True** should be printed if one of the given numbers is a negative number and the sum of numbers is greater than `7`, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = 13` and `B = -3`,

✓ One of the given numbers is a negative number. (`-3` is a negative number)

✓ Sum of the given numbers is greater than `7`. (`13 + (-3) = 10`, `10` is greater than `7`)

The output should be **True**.

Sample Input 1

```
13
-3
```

Sample Output 1

```
True
```

Sample Input 2

```
14
-7
```

Sample Output 2

```
False
```

code:

```
A=int(input())
B=int(input())
c=A+B
print(((A<0)or(B<0))and c>7)
```

7.

Compare Numbers - 3 | 25/25

Solved

Easy

Write a program that reads two numbers `A` and `B`, and checks if both `A` and `B` are positive numbers or both `A` and `B` are less than `70`.

Input

The first line of input contains an integer representing `A`.
The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a boolean. **True** should be printed if both `A` and `B` are positive numbers or both `A` and `B` are less than `70`, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = 200` and `B = 50`,
✓ `A` and `B` are positive numbers. (`200` and `50` are positive numbers)
✗ `A` and `B` are less than `70`. (`200` is not less than `70`)
The output should be **True** as both `A` and `B` are positive numbers.

Sample Input 1

```
200
50
```

Sample Output 1

```
True
```

Sample Input 2

```
-7
70
```

Sample Output 2

```
False
```

code:

```
A=int(input())
B=int(input())
print(((A>0)and (B>0)) or ((A<70) and (B<70)))
```

8.

Compare Numbers - 4 🟡 25/25

● Solved

Easy

Write a program that reads two numbers `A` and `B`, and checks if one of `A` and `B` is less than **60** and one of `A` and `B` is greater than **80**.

Input

The first line of input contains an integer representing `A`.
The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a boolean. **True** should be printed if one of `A` and `B` is less than **60** and one of `A` and `B` is greater than **80**, otherwise **False** should be printed.

Explanation

For example, if the given numbers are `A = 50` and `B = 90`,
✓ One of `A` and `B` is less than **60**. (**50** is less than **60**)
✓ One of `A` and `B` is greater than **80**. (**90** is greater than **80**)
The output should be **True**.

Sample Input 1

```
50
90
```

Sample Output 1

```
True
```

Sample Input 2

```
230
70
```

Sample Output 2

code:

```
A=int(input())
B=int(input())
print(((A<60)or(B<60)) and ((A>80)or (B>80)))
```
