

cp_3a

1.

Positive Integer | 🟡 25/25

Easy

Write a program that reads a number and converts it to a positive number.

If the given number is negative, convert it to a positive number and print it. Otherwise, print the given number.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a positive integer.

Explanation

For example, if the given number is **-5**,

- **-5** is a negative number.
- **-5** should be converted to a positive number which is **5**.

The output should be **5**.

For example, if the given number is **39**,

- **39** is a positive number.

The output should be **39**.

Sample Input 1

- 5

Sample Output 1

5

Sample Input 2

3 9

Sample Output 2

3 9

code:

```
n=int(input())
if(n<=0):
```

```
n=n*(-1)
print(n)
else:
    print(n)
```

2.

Exam Result | 🏆 20/20

Write a program that reads the student's marks as input and prints PASS or FAIL.If the student has scored more than 50, print PASS.
In all other cases print FAIL.

Input

The input will be a single line containing a number.

Output

The output should be a single line containing PASS or FAIL.

Explanation

In the given example, the student's marks are 85, which is more than 50, so the result should be PASS.
Similarly, if the marks are 45, the result should be FAIL.

Sample Input 1

85

Sample Output 1

PASS

Sample Input 2

45

Sample Output 2

FAIL

Sample Input 3

50

Sample Output 3

FAIL

code:

```
n=int(input())
if(n > 50):
    print("PASS")
else:
    print("FAIL")
```

3.

Greatest Among Two Numbers - 3 | 🏆 25/25

Write a program that reads two numbers `A` and `B` and prints the greatest among the two numbers.

Input

The first line of input contains an integer representing `A` .
The second line of input contains an integer representing `B` .

Output

The output should be a single line containing an integer that is the greatest among the two numbers.

Explanation

For example, if the given numbers are `A = 4` and `B = 3` , the output should be `4` as `4` is greater than `3`.

Sample Input 1

```
4
3
```

Sample Output 1

```
4
```

Sample Input 2

```
15
7
```

Sample Output 2

```
15
```

code:

```
a=int(input())
b=int(input())
if(a>b):
    print(a)
```

```
else:
    print(b)
```

4.

Vote Eligibility | 🟡 20/20

● Solved

Write a program that reads the age of a person and checks if the age of the person is **greater than or equal to 18** for eligibility to vote.

Print **Eligible** if the age of the person is **greater than or equal to 18**, otherwise print **Not Eligible**.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a string. **Eligible** should be printed if the age of the person is **greater than or equal to 18**, otherwise **Not Eligible** should be printed.

Note

Ensure strings in all print statements are exactly the same as mentioned in the question text to pass all the test cases.

Explanation

For example,

If the given age of a person is **15**, the output should be **Not Eligible** as **15** is not greater than or equal to **18**.

If the given age of a person is **21**, the output should be **Eligible** as **21** is greater than **18**.

Sample Input 1

15

Sample Output 1

Not Eligible

Sample Input 2

21

Sample Output 2

Eligible

code:

```
age=int(input())
if(age>=18):
    print("Eligible")
else:
    print("Not Eligible")
```

5.

Relation b/w Numbers | 🟡 25/25

Easy

Write a program to print the relation between two numbers, X and Y .

Input

The first line is integer X .

The second line is integer Y .

Output

Print $X < Y$ if X is less than Y otherwise, print $X \geq Y$.

Note

Ensure strings in all print statements are exactly the same as mentioned in the question text to pass all the test cases.

Explanation

Given $X = 2$, $Y = 5$

As $2 < 5$ ($X < Y$)

So the output is $X < Y$

Sample Input 1

```
2
5
```

Sample Output 1

```
X < Y
```

Sample Input 2

```
5
2
```

Sample Output 2

```
X ≥ Y
```

code:

```
x=int(input())
y=int(input())
if(x < y):
    print("X < Y")
else:
    print("X >= Y")
```

6.

Equal Numbers | 🍌 20/20

Write a program to check if the given two numbers are equal.

Input

The first line of input contains a number.

The second line of input contains a number.

Output

If the given numbers are equal, print "Equal". In all other cases, print "Not Equal".

Explanation

For example, if the first number is 5 and the second number is 5. Since both the given numbers are equal. So the output should be "Equal".

Whereas, if the first number is 10 and the second number is 5, both the numbers are not equal. So the output should be "Not Equal".

Sample Input 1

```
5
5
```

Sample Output 1

```
Equal
```

Sample Input 2

```
10
5
```

Sample Output 2

```
Not Equal
```

code:

```
X= int(input())
Y=int(input())
if(X==Y):
    print("Equal")
else:
    print("Not Equal")
```

7.

Square or Rectangle | 🟡 20/20

● Solved

Given the length and breadth of a box, check if it is a Rectangle or Square.

Input

The first line of input will contain the length of the box.
The second line of input will contain the breadth of the box.

Output

If the given length and breadth are equal, print "Square". In all other cases, print "Rectangle".

Explanation

For example, if the given length is 6, and the given breadth is 6, the length and breadth are equal. So the output should be "Square".
Similarly, if the given length is 5, and the breadth is 10, the length and breadth are not equal. So the output should be "Rectangle".

Sample Input 1

```
6
6
```

Sample Output 1

```
Square
```

Sample Input 2

```
5
10
```

Sample Output 2

```
Rectangle
```

code:

```
length=int(input())
breadth=int(input())
if (length==breadth):
    print("Square")
else:
    print("Rectangle")
```

8.

Easy

Write a program that reads a temperature and checks if the given temperature is between **15** and **40**.

Print **Can go for a walk** if the given temperature is between **15** and **40**, otherwise print **Cannot go for a walk**.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a string. **Can go for a walk** should be printed if the temperature is between **15** and **40**, otherwise **Cannot go for a walk** should be printed.

Explanation

For example, if the given temperature is **26**,

- **26** is greater than **15**.
- **26** is less than **40**.
- So, **26** is between **15** and **40**.

The output should be **Can go for a walk** as **26** is between **15** and **40**.

Sample Input 1

26

Sample Output 1

Can go for a walk

Sample Input 2

5

Sample Output 2

Cannot go for a walk

code:

```
tem=int(input())
if(tem>15 and tem<40):
    print("Can go for a walk")
else:
    print("Cannot go for a walk")
```

9.

Buy a Book | 20/20

Solved

Easy

Write a program that reads the size `S` and page count `C` of a book and checks if `S` is equal to **large** or `C` is greater than or equal to **300**.

Print **Buy a Book** if `S` is equal to **large** or `C` is greater than or equal to **300**. Otherwise, print **Do Not Buy a Book**.

Input

The first line of input contains a string representing `S`.

The second line of input contains an integer representing `C`.

Output

The output should be a single line containing a string. **Buy a Book** should be printed if `S` is equal to **large** or `C` is greater than or equal to **300**. Otherwise, **Do Not Buy a Book** should be printed.

Explanation

For example, if the given size is `S = "large"` and the page count is `C = 80`,

✓ `S` is equal to **large**. (**large** is equal to **large**)

X `C` is greater than or equal to **300**. (**80** is not greater than or equal to **300**)

The output should be **Buy a Book** as the size of the book `S` is equal to **large**.

Sample Input 1

```
large
80
```

Sample Output 1

```
Buy a Book
```

Sample Input 2

```
small
200
```

Sample Output 2

```
Do Not Buy a Book
```

code:

```
s=input()
c=int(input())
if(s=="large" or c>=300):
    print("Buy a Book")
else:
    print("Do Not Buy a Book")
```

10.

Pair of Numbers | 🟡 20/20

● Solved

Easy

Write a program that reads two numbers `A` and `B` and checks if both `A` and `B` are less than or equal to `1000` or `B` is greater than `500`.

Print **Pair** if both `A` and `B` are less than or equal to `1000` or `B` is greater than `500`. Otherwise, print **Not a Pair**.

Input

The first line of input contains an integer representing `A`.

The second line of input contains an integer representing `B`.

Output

The output should be a single line containing a string. **Pair** should be printed if both `A` and `B` are less than or equal to `1000` or `B` is greater than `500`. Otherwise, **Not a Pair** should be printed.

Explanation

For example, if the given numbers are `A = 300` and `B = 200`,

✓ Both `A` and `B` are less than or equal to `1000`. (`300` and `200` are less than or equal to `1000`)

X `B` is greater than `500`. (`200` is not greater than `500`)

The output should be **Pair** as both `300` and `200` are less than or equal to `1000`.

Sample Input 1

```
300
200
```

Sample Output 1

```
Pair
```

Sample Input 2

```
1464
20
```

Sample Output 2

```
Not a Pair
```

code:

```
a=int(input())
b=int(input())
if( (a <=1000) and (b<=1000)) or b>500):
    print("Pair")
else:
    print("Not a Pair")
```

11.

Easy

Write a program that reads the scores `A` and `B` of two players and checks if one of the scores is greater than `300` and the sum of the scores is less than `500`.

Print **Can team up** if one of the scores is greater than `300` and the sum of the scores is less than `500`, otherwise print **Cannot team up**.

Input

The first line of input contains an integer representing the score `A`.

The second line of input contains an integer representing the score `B`.

Output

The output should be a single line containing a string. **Can team up** should be printed if one of the scores is greater than `300` and the sum of the scores is less than `500`, otherwise **Cannot team up** should be printed.

Explanation

For example, if the given scores are `A = 350` and `B = 134`,

✓ One of the scores is greater than `300` (`350` is greater than `300`).

✓ The sum of scores is less than `500` (`350 + 134 = 484`, `484` is less than `500`).

The output should be **Can team up** as one of the scores is greater than `300` and the sum of the scores is less than `500`.

Sample Input 1

```
350
134
```

Sample Output 1

```
Can team up
```

Sample Input 2

```
450
82
```

Sample Output 2

```
Cannot team up
```

code:

```
sc1=int(input())
sc2=int(input())
sum=sc1+sc2
if(((sc1>300)or(sc2>300)) and sum <500):
    print("Can team up")
else:
    print("Cannot team up")
```

12.

Zero or Positive 🟡 20/20

● Solved

Easy

Write a program that reads a number and checks if the given number is equal to **0** or positive.

Print **Zero** if the given number is equal to **0**.

Print **Positive** if the given number is a positive number.

Note

Positive numbers are numbers that are greater than **0**.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a string. **Zero** should be printed if the given number is equal to **0**. **Positive** should be printed if the given number is greater than **0**.

Explanation

For example, if the given number is **56**, the output should be **Positive** as **56** is greater than **0**.

Sample Input 1

56

Sample Output 1

Positive

Sample Input 2

0

Sample Output 2

Zero

code:

```
n=int(input())
if(n<=0):
    print("Zero")
else:
    print("Positive")
```

13.

Zero or Positive or Negative | 🟡 25/25

● Solved

Write a program that reads a number and checks if the given number is zero, positive or negative.

Print **Zero** if the given number is equal to **0**.

Print **Positive** if the given number is greater than **0**.

Print **Negative** if the given number is less than **0**.

Input

The input will be a single line containing an integer.

Output

The output should be a single line containing a string. **Zero** should be printed if the given number is equal to **0**. **Positive** should be printed if the given number is greater than **0**. **Negative** should be printed if the given number is less than **0**.

Explanation

For example,

- If the given number is **-12**, the output should be **Negative** as **-12** is less than **0**.
- If the given number is **15**, the output should be **Positive** as **15** is greater than **0**.

Sample Input 1

-12

Sample Output 1

Negative

Sample Input 2

15

Sample Output 2

Positive

Sample Input 3

0

Sample Output 3

Zero

code:

```
n=int(input())
if(n==0):
    print("Zero")
if(n > 0):
    print("Positive")
if(n<0):
    print("Negative")
```
